Core Capabilities

- Executive Reporting Automation
- KPI Framework Design
- Business Intelligence
- Workflow Automation
- Operational Analytics
- Stakeholder Reporting

Context

A leading food and beverage manufacturer managed monthly Health & Safety reporting through highly manual processes.

Health and Safety data was distributed across a SaaS platform and multiple spreadsheets used to complement information not captured by the system, including incident classifications, root cause analyses, and corrective action tracking.

Every month, KPIs were manually calculated, copied into PowerPoint presentations, and customized for different stakeholder groups.

The objective was to automate the entire executive reporting process while ensuring consistent, reliable, and timely information.

Well-designed dashboards do more than visualize data — they enable leadership teams to identify trends, monitor performance, and make faster, data-driven decisions with confidence.

The Challenge

Monthly executive reporting required extracting data from multiple sources, manually consolidating records, recalculating KPIs, updating charts, and preparing separate presentations for different stakeholder groups.

The process was repetitive, time-consuming, and highly dependent on manual work, increasing the risk of inconsistencies and delaying executive decision-making.

As a result, reporting cycles became slow, executive visibility was limited, and decision-making relied on delayed information.

- **Fragmented data across SaaS and spreadsheets.**
- **Manual KPI calculations.**
- **Manual PowerPoint reporting.**
- **Multiple stakeholder-specific reports.**
- **Repetitive monthly reporting cycle.**
- **High risk of reporting errors.**

THE APPROACH

Rather than automating isolated reporting tasks, I designed an end-to-end Executive Reporting System that centralized operational data, standardized KPI calculations, and automated the complete reporting lifecycle.

The solution combined data integration, business rules, interactive dashboards, and workflow automation to provide each stakeholder with consistent, real-time information while eliminating repetitive manual reporting activities and simplifying monthly governance processes.

Solution Desing

Implemented

- Designed a standardized executive reporting framework supporting multiple organizational levels.
- Structured stakeholder-specific dashboards while maintaining a single centralized data model.
- Standardized KPI definitions and reporting logic across all reports.
- Integrated incident information extracted from the AMATIA SaaS platform.
- Consolidated additional operational datasets including incident classifications, operational areas, root cause analyses, corrective action plans, and responsible owners.
- Unified frequency and severity indicators with operational incident data.
- Built a centralized relational reporting model connecting operational and analytical datasets.
- Designed business logic to support reporting at: Plant level, Business Unit level, Company level, Corporate consolidated level.
- Developed interactive dashboards with dedicated reporting pages for: Plant Management, Supply Chain Management, Health & Safety Leadership, Human Resources Leadership.
- Automated charts, executive KPIs, trends, and operational summaries.
- Developed automated monthly reporting workflows using Google Apps Script.
- Scheduled validation requests on the fifth business day of each month.
- Automated PDF generation after user approval.
- Integrated the workflow with the Gmail API to distribute finalized reports automatically to predefined stakeholder mailing lists.
- Eliminated repetitive report preparation and email distribution tasks.

Skills Demonstrated

Business Intelligence

- Executive Reporting
- KPI Framework Design
- Dashboard Design
- Operational Analytics
- Data Visualization

Business Analysis

- Stakeholder Analysis
- Business Requirements Gathering
- Process Optimization
- Reporting Standardization

Project Management

- Stakeholder Management
- Cross-functional Collaboration
- Process Governance

Data Engineering

- Data Integration
- Data Modeling
- Relational Data Design
- ETL Process Design

Automation

- Workflow Automation
- Reporting Automation
- Scheduled Processes
- API Integration

Tools Integration

Tools Used

Business Intelligence

- Looker Studio

Data Management

- Google Sheets
 - QUERY
 - ARRAYFORMULA
 - Pivot Tables
 - Data Validation

Automation

- Google Apps Script
- Gmail API
- Time-driven Triggers

Data Sources

- AMATIA SaaS Platform

Collaboration

- Google Workspace

DATA ARCHITECTURE

Automating Executive Safety Reporting Across Multiple Organizational Levels

THE RESULTS

Karime Martinez
Business Operations & Data Analyst

The project transformed a repetitive, manually driven reporting process into an automated Executive Reporting System.

By integrating operational data, standardizing KPI calculations, and automating report generation and distribution, the organization significantly improved reporting efficiency, reduced the risk of manual errors, and ensured executives received consistent, timely information to support operational and strategic decision-making.

Business Impact

- Eliminated manual preparation of monthly executive reports across multiple organizational levels.
- Standardized KPI definitions and reporting structures for all stakeholders.
- Integrated data from the AMATIA SaaS platform and complementary operational databases into a centralized reporting model.
- Automated monthly validation, PDF generation, and email distribution using Google Apps Script and the Gmail API.
- Reduced reporting cycle time from several hours of manual work to a streamlined approval and distribution process.
- Improved consistency, traceability, and reliability of executive Health & Safety reporting.
- Enabled near real-time access to operational safety performance through interactive dashboards tailored to each stakeholder group.

Your team should spend less time preparing reports and more time acting on insights. **Let's automate your reporting processes so your data works for your business—not the other way around.**
